Background & Context

| CLIENT OVERVIEW

About the Client

Sarvatra Technologies Pvt. Ltd. is a BFSI/Fintech domain IT company providing Switch services to banks across India. The Finance and Accounts teams relied heavily on manual processes and fragmented Excel-based reporting to track revenue, expenses, transaction volumes, and settlement timelines — resulting in delays, inconsistencies, and limited visibility for senior management.

My Role

I was deployed by Opine Group as the sole on-site BA and BI resource at Sarvatra Technologies — independently owning end-to-end project delivery from initial requirements through to dashboard sign-off, with no on-site team support. Initial guidance on dimensional modelling approach was provided by my senior manager at Opine, after which I drove the full technical and analytical implementation independently.

02

Business Problem

| PAIN POINTS

PAIN POINT	BUSINESS IMPACT
Manual financial reporting caused delays and errors in tracking KPIs	Late and inaccurate management reporting; poor visibility into financial health
Data consolidation from TallyERP and Excel was time-consuming and error-prone	Reconciliation inconsistencies impacting financial analysis and decision-making
Existing reports lacked real-time visibility into financial and banking metrics	Senior management operating on stale data; reactive rather than proactive decisions
No automated, interactive dashboards for financial oversight and strategic planning	Monthly and quarterly reviews dependent on manual, delayed report preparation

03 Role & Responsibilities | DELIVERY SCOPE

Requirement Gathering & Stakeholder Collaboration

- Conducted requirement workshops with Finance, Accounts, and Senior Management to define dashboard objectives and reporting needs
- Identified key KPIs including revenue trends, settlement timelines, accounts receivable tracking, and financial reconciliation metrics
- Defined business requirements for dashboard functionalities — ensuring they directly addressed pain points in existing financial reporting
- Maintained ongoing stakeholder communication to manage expectations and ensure alignment throughout delivery

Gap Analysis & Process Improvement

- Evaluated current reporting inefficiencies — including manual data consolidation, reconciliation inconsistencies, and lack of real-time visibility
- Identified gaps between existing processes and desired outcomes — recommending automation and enhanced data visualisation
- Ensured alignment of data structure and reporting requirements with business goals before moving to technical design

Documentation & Functional Design

- Created and maintained full project documentation — BRDs, functional specifications, ERDs, data dictionaries, and process workflows
- Designed the dimensional data model to support financial reporting requirements — incorporating revenue, expenses, debtor tracking, and settlement timelines
- Collaborated with the reporting layer to define data visualisation structures for intuitive dashboard design

Technical Implementation

- Integrated data from TallyERP and Excel sources into a unified dimensional data model — consolidating fragmented financial data into a single reliable reporting layer
- Designed and implemented ETL packages (SSIS) and SQL queries — enabling reliable, automated data flow from source systems into the reporting layer
- Built a centralised finance dashboard and multiple SSRS analytics reports covering revenue, expenses, accounts receivable, dues tracking, and management reviews

UAT & Deployment Support

- Designed test scenarios and validation criteria to ensure dashboard accuracy against source financial data
- Conducted UAT with Finance users — verifying all dashboard outputs and report figures against TallyERP and Excel source records
- Managed feedback cycles, implemented refinements, and obtained formal stakeholder sign-off before deployment

04 Outcomes & Impact | RESULTS

REPORTING SPEED Hrs → Min Report generation time cut from hours to minutes	SOURCES UNIFIED 2 TallyERP + Excel into a single dimensional model	DELIVERY MODEL Solo End-to-end BA + BI as sole on-site resource
---	---	--

Operational Impact

- Eliminated manual financial report consolidation — significantly reducing time, effort, and error risk
- Report generation time reduced from hours to minutes — enabling faster financial analysis and more timely management decision-making
- Finance and Accounts teams gained real-time visibility into key financial metrics — replacing fragmented, delayed reporting

Business Impact

- Senior Management gained access to interactive dashboards enabling monthly and quarterly performance reviews
- Accounts receivable tracking and dues follow-up enabled more proactive debtor management
- Improved data accuracy and consistency — reducing reconciliation errors and supporting more reliable financial planning
- Foundation established for scalable, data-driven financial reporting across the organisation

"Consolidating fragmented data sources into a single dimensional model is the foundation of reliable BI delivery."

05 Key Learnings & Takeaways | REFLECTIONS

- Aligning stakeholder expectations early — across Finance, Accounts, and Senior Management — ensures a clear, shared project direction
- Gap analysis is critical for identifying reporting inefficiencies before jumping to technical solutions
- Sole on-site delivery demands strong self-management, clear communication, and end-to-end ownership across both BA and BI tracks
- User involvement in UAT improves adoption and ensures the final solution genuinely addresses business needs
- Consolidating fragmented data sources into a single dimensional model is the foundation of reliable BI delivery

06 Conclusion | CLOSING

This engagement demonstrates end-to-end BA and BI delivery in a BFSI context — from requirement gathering and gap analysis through to dimensional modelling, ETL development, dashboard build, UAT, and sign-off. Working as the sole on-site resource, I independently translated fragmented, manual financial processes into a centralised, automated analytics solution — delivering measurable improvements in reporting speed, data accuracy, and management visibility.
